Compress the complexity of modern web apps.

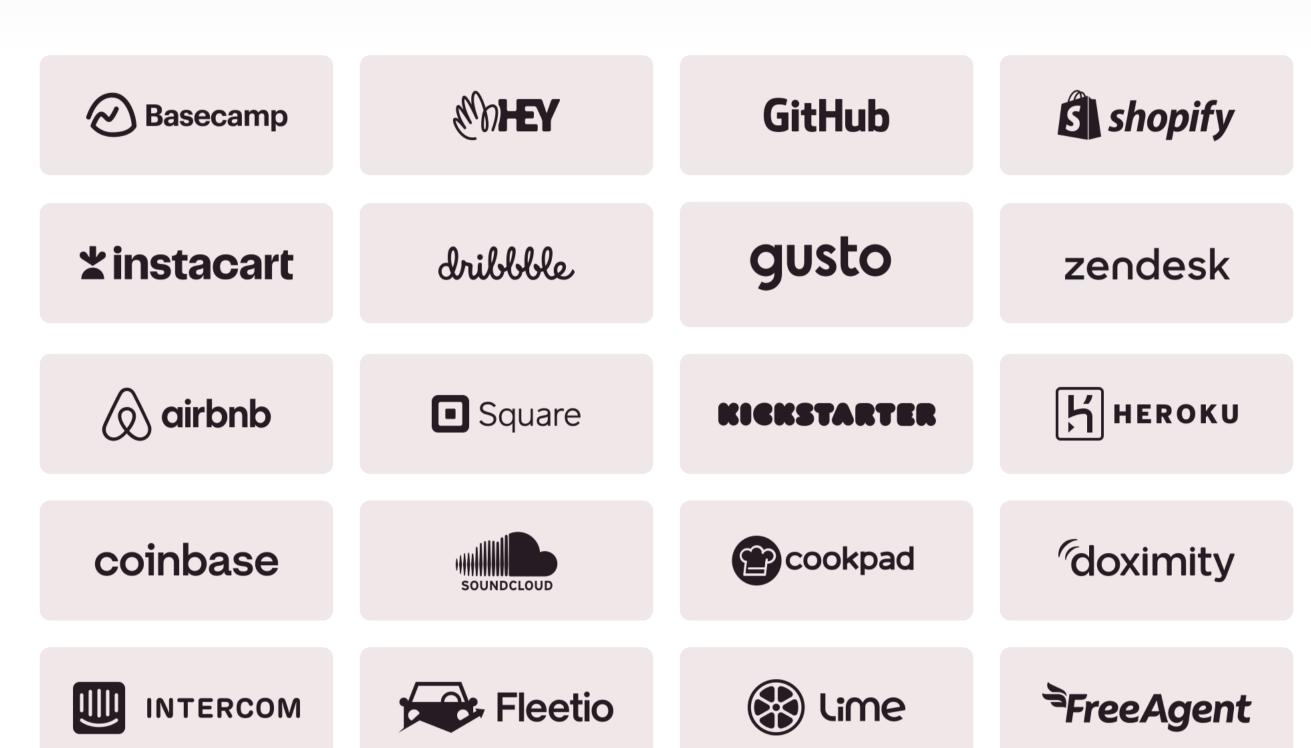

Learn just what you need to get started, then keep leveling up as you go. Ruby on Rails scales from HELLO WORLD to IPO.

Rails 8.0.1 — released December 13, 2024

You're in good company.

Over the past two decades, Rails has taken countless companies to millions of users and billions in market valuations.

These are just a few of the big names. There have been many hundreds of thousands of apps created with Rails since its inception.

Building it together.

Over six thousand people have **contributed code to Rails**, and many more have served the community through evangelism, documentation, and bug reports. Join us!

Meet the Rails team >

Everything you need. Rails is a full-stack framework. It ships with all the tools needed

to build amazing web apps on both the front and back end.

Rendering HTML templates, updating databases, sending and receiving emails, maintaining live

pages via WebSockets, enqueuing jobs for asynchronous work, storing uploads in the cloud, providing solid security protections for common attacks. Rails does it all and so much more.

```
class Article < ApplicationRecord</pre>
 belongs_to :author, default: -> { Current.user }
 has_many :comments
  has_one_attached :cover_image
 has_rich_text :content, encrypted: true
 enum status: %i[ drafted published ]
  scope :recent, -> { order(created_at: :desc).limit(25) }
  after_save_commit :deliver_later, if: :published?
  def byline
    'Written by #{author.name} on #{created_at.to_s(:short)}'
  end
 def deliver_later
   Article::DeliveryJob.perform_later(self)
 end
end
   Active Records make modeling easy.
Databases come to life with business logic encapsulated in rich objects.
```

app/models/article.rb

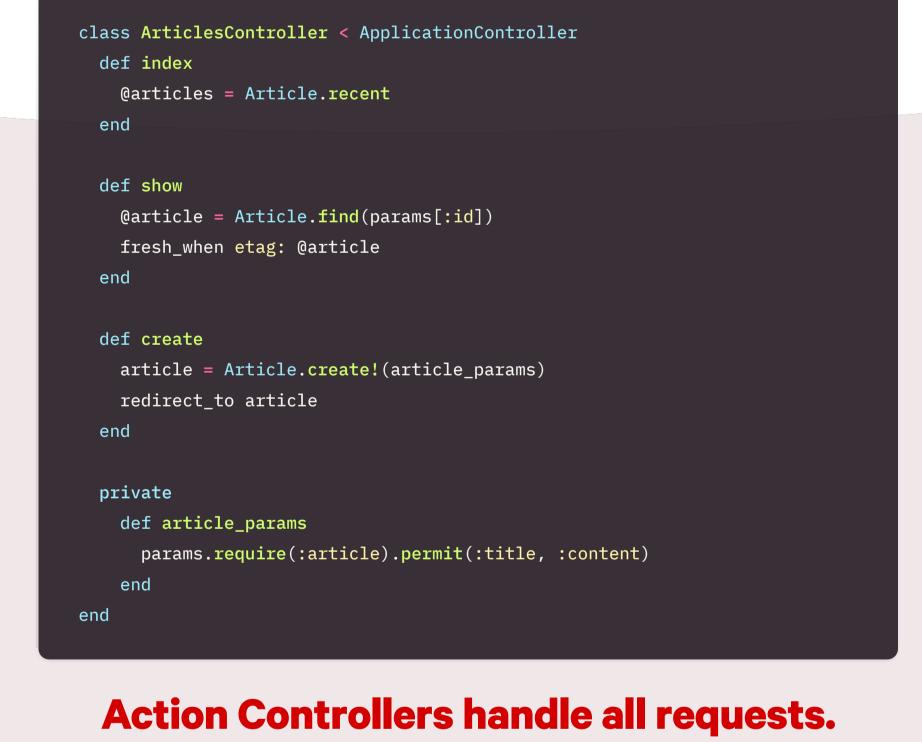

Modeling associations between tables, providing callbacks when saved,

encrypting sensitive data seamlessly, and expressing SQL queries beautifully.

app/views/articles/show.html.erb

extracted into helpers, and the domain model is used directly and interwoven with the HTML.

app/controllers/articles_controller.rb

Controllers expose the domain model to the web, process incoming parameters, set caching headers, and render templates, responding with either HTML or JSON.

config/routes.rb

```
Rails.application.routes.draw do
                         # /articles, /articles/1
  resources :articles do
                         # /articles/1/comments, /comments/1
   resources :comments
 end
  root to: "articles#index" # /
end
         Action Dispatch routes URLs.
   Configure how URLs connect to the controllers using the routing
```

domain language. Routes expose the bundle of actions that go together as a resource: index, show, new, create, edit, update, destroy.

Rails has united and cultivated a strong tribe around a wide set of heretical thoughts about the nature of programming and programmers. Understanding these thoughts will help you understand the design of the framework.

Optimized for happiness.
